

PRE-SYNOPSIS

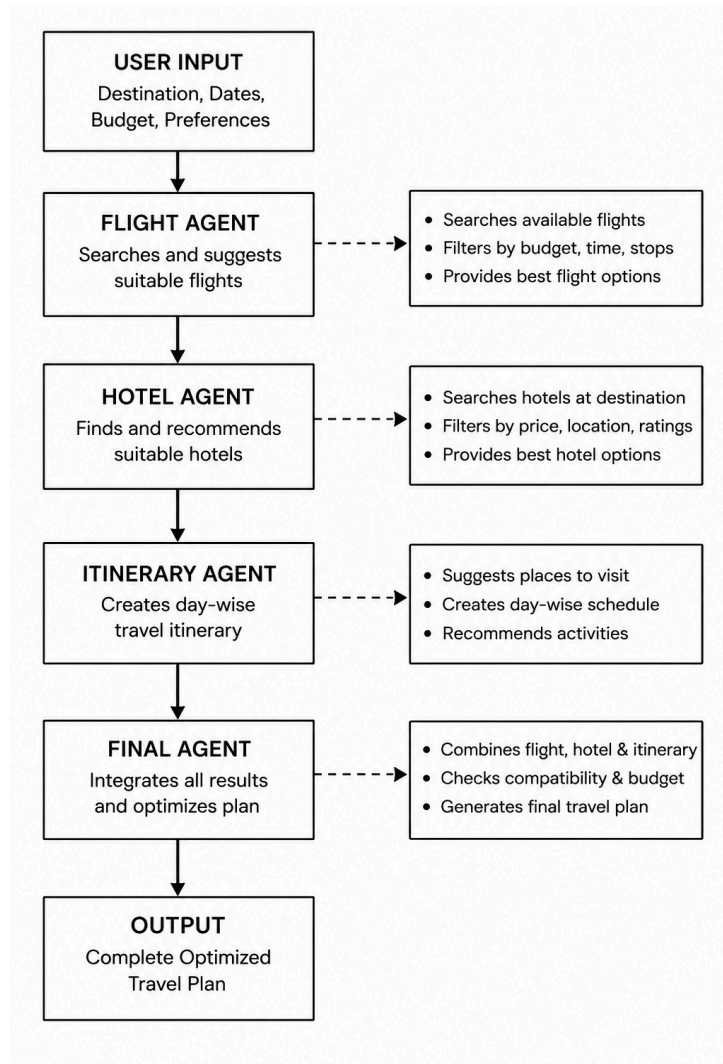

Title of Project: Multi-Agent Travel Planning System

Area: Artificial Intelligence / Multi-Agent Systems

Project Type: Software Development (AI-Based Project)

Project Description: The Multi-Agent Travel Planning System is designed to simplify and automate the travel planning process using intelligent agents. The system consists of multiple agents, each responsible for a specific task. The Flight Agent searches and suggests suitable flights based on user preferences such as budget, destination, and timing. The Hotel Agent recommends hotels considering price, location, and user ratings. The Itinerary Agent creates a structured day-wise travel plan including places to visit and activities. Finally, the Final Agent integrates outputs from all agents and provides an optimized and complete travel plan to the user. This system reduces manual effort, saves time, and provides accurate and personalized travel solutions. The user provides input such as destination, travel dates, and budget. The Flight Agent searches for available flights. The Hotel Agent finds suitable accommodation options.
